

# How to choose a university?

## do my homework for me cheap

Most of the applicants until the last moment cannot determine the place where they want to learn after graduating from school or college. For many, the choice of university passes in the stressful situation. It seems that only a few days ago wrote an exam, i.e. One stress was transferred, as suddenly, another stress fell on your shoulders - admission to the university.

So now come relatively easy; If the exam is written well, you will not have problems with intake. Another question: where to submit documents? After all, when there is a goal (a specific university), then you have much less trouble, rather than when there are several such goals (several universities).

Such diversification ("spraying"), on the one hand, leads to an additional effort, and, on the other, it reduces the risks of non-notion.

And yet, in my opinion, such a diversification is needed. No wonder the state provides the possibility of submitting documents to several universities.

At the same time it is necessary to decide on the list of potential higher educational institutions. In order to make the optimal and most competent selection, several criteria should be taken into account. You, in your will, can form a list of criteria on your own.

I just show you an example of those criteria that, as I think, should be considered when choosing a university.

How to choose a university: the algorithm for the right choice

After we choose the criteria, further, it is necessary to assign a certain weight to each criterion, so that in the amount, all the criteria have a weight equal to 1. Weight shows the importance of the criterion for you. Then, opposite each criterion, in addition to the weight, you should put your assessment. The assessment shows the compliance of the university given to the criterion.

Yes, yes, I understand that you are unlikely to understand something :). It is very difficult to immediately understand text information. But nothing! Read on, there I will decompose everything on the shelves so that you understand everything, not really straining. For now, you are offered to your attention the algorithm for the right choice of the university.

Algorithm for the right choice of the university:

1. Determine the criteria.

2. Slip weight for each criterion.
3. Put an assessment for each criterion.
4. We find the amount of works for each university.
5. We look at the final results, choose the triple of the winners.

Someone can say: where are the universities actually? What will we evaluate? Here I will say the following: Before you choose a university you need to make a list of potential universities wherever you want to do, or where your loved ones want to do.

Although, almost no one knows in advance where he will come, however, probably everyone has a certain potential list of universities in the head, where you could submit documents.

Our task is to reduce your potential list of up to three universities, to then make the final choice - where learns.

Therefore, you can add a zero step towards our algorithm: "We write a list of potential universities." Then our algorithm with you will take the form:

0. We write a list of potential universities.
1. Determine the criteria.
2. Slip weight for each criterion.
3. Put an assessment for each criterion.
4. We find the amount of works for each university.
5. We look at the final results, choose the triple of the winners.
